Master the chemistry that the rest of AP® Biology is built on.

Unit 1 introduces the ideas you will use all year: how water's polarity makes life possible, how cells build and break down macromolecules, and how a molecule's structure determines its function. This guide explains each idea clearly, then gives you the practice you need to answer exam-style questions with confidence.

- **Focused lessons on all six Unit 1 topics: water, elements of life, macromolecules, protein structure, and nucleic acids**
- **Annotated diagrams you can learn to draw from memory**
- **Misconception alerts and exam tips on every topic**
- **58 original multiple-choice questions with full explanations**
- **Three free-response questions with point-by-point scoring guidelines**
- **Master comparison tables, a one-page review sheet, glossary, and score tracker**

Ideal for students enrolled in AP Biology, for summer preparation, and for review before unit tests and the AP Exam.
